Table B-1. Potential Biological Warfare Agents (Continued).

* Ribavirin shown to have experimental effectiveness.

1. Transmission can be by aerosol - A, direct contact - D, ingestion-I, and vector-V.
2. Incubation periods and mortality rates vary according to a number of factors (e.g., ability of the host to resist infection, infective dose, portal of entry, and virulence of the microorganism).
3. + indicates vaccine available but of questionable value; ++ indicates vaccine available but mainly used in high risk individuals; + + + indicates vaccine used extensively; - indicates no vaccine available.
4. E indicates effective treatment available; N indicates no specific treatment.
5. The mortality rate is lower due to skin form; mortality rate higher due to respiratory form.
6. Treatment must be initiated in the earliest stage of the pulmonary form to be effective.
7. Includes both bubonic and pneumonic forms.
8. Mosquitoes are thought to be the primary vectors, but this has not been proved.

Mortality rates for untreated/exposed personnel.

High = 50% or greater

Moderate = 15 - 50%

Low = >1 - 15%
